Older-model cars used the 12-volt ignition coils to provide power to the spark plugs. These coils had very simple wiring. They usually required only three wires: the spark plug wire, the power wire and the ignition switch wire. Ignition coils of this type are usually a little larger than a soda can and are heavy because of the metal core and the field coil windings.

The coil's ground side connects to breaker points, which are connected by a lever to a cam in the middle of the distributor. When the lever is pushed by the cam, the coil loses its ground and creates its high-voltage pulse. The breaker points are also responsible for the spark's timing. The timing is critical to proper engine performance.
