Combination Reactions (also called Synthesis Reactions) occur when two or more substances, elements or compounds, combine to form one new substance. For example, hydrogen and oxygen gases combine to give water: $\text{H}_2(\text{g}) + \text{O}_2(\text{g}) \rightarrow 2\text{H}_2\text{O}(\text{l})$ Decomposition Reactions occur when a compound breaks apart to yield two or more new substances. As an example, potassium chlorate decomposes when heated to yield potassium chloride and oxygen gas.

TYPES OF CHEMICAL REACTIONS LAB PART#1

The reactants and products determine the type of chemical reaction. If there are more products than reactants, then it is a decomposition reaction. If there are more reactants than products, it is a synthesis reaction. If oxygen is a part of the reactant, it is a combustion reaction. If one ion replaces another, it is a single replacement reaction.

Lab: Types of Reactions Assignment: Reflect on the Lab ...

There are many kinds of chemical reactions and several ways to classify them. One useful method classifies reactions into four major types. These are: direct combination, or synthesis. decomposition, or analysis. single replacement. exchange of ions, or double replacement. Not all reactions can be put into one of these categories. Many, however, can.
